

Package ‘hammond’

January 31, 2018

Type Package
Title Useful analysis utilities
Version 0.1.0
Author David Hammond
Maintainer David Hammond <anotherdavidhammond@gmail.com>
Description Just some useful stuff for me
License GPL-3
Encoding UTF-8
LazyData true
RoxygenNote 6.0.1

R topics documented:

hammond-package	1
hcorr	2
hcountrycode	2
hfactor	3
hpack.manual	3
hpc.change	3
hproject	4
ipak	4
split	4
Index	5

hammond-package	<i>hammond: some stuff</i>
-----------------	----------------------------

Description

hammond: some stuff

Installation

```
devtools::install_github("david-hammond/hammond")
```

hcorr	<i>hcorr</i>
-------	--------------

Description

This function calculates correlations between variables

Usage

```
hcorr(df, min.pairs = 20, verbose = TRUE, filter.by.p = FALSE)
```

Arguments

df	name of dataframe to use for correlation, needs to be long format 4 column data frame: iso3c, variablename, year, value
min.pairs	minimum number of pairs to correlate
verbose	enable n and p values reporting, TRUE or FALSE
filter.by.p	Do you want to filter for significant p values?

Examples

```
#need 4 column data frame, iso3c, variablename, year, value
```

hcountrycode	<i>hcountrycode</i>
--------------	---------------------

Description

This function calculates correlations between variables

Usage

```
hcountrycode(countries = c("ALG", "ALB", "UKG", "CAN", "USA"))
```

Arguments

countries	list of countries
-----------	-------------------

Examples

```
#need 4 column data frame, iso3c, variablename, year, value
```

hfactor	<i>Factor based on order</i>
---------	------------------------------

Description

This makes a factor out of an ordered array

Usage

```
hfactor(x, y = unique(x))
```

Arguments

x	array to factorise
y	order of factors

hpack.manual	<i>create package manual</i>
--------------	------------------------------

Description

This function calculates combinations for efficient correlation calculations

Usage

```
hpack.manual(pack = "hammond")
```

Arguments

pack	name of package
------	-----------------

hpc.change	<i>Calculate proportional change</i>
------------	--------------------------------------

Description

This function calculates proportional change in GPI for a country from one year to another.

Usage

```
hpc.change(all)
```

Arguments

all	the dataframe to be processed
-----	-------------------------------

Value

Returns a dataframe containing the raw and annual growths in GPI for each country

hproject	<i>hcreate.project</i>
----------	------------------------

Description

This function creates a minimal project folder structure

Usage

```
hproject(dir = getwd())
```

ipak	<i>install dependencies</i>
------	-----------------------------

Description

easy install for R packages, sourced from <https://gist.github.com/stevenworthington/3178163>

Usage

```
ipak(pkg)
```

Arguments

pkg	a string or list of packages to install
-----	---

split	<i>Create a two factor list</i>
-------	---------------------------------

Description

Create a two factor list

Usage

```
split(df, factor1, factor2)
```

Arguments

df	name of dataframe
factor1	first factor to split on
factor2	second factor to split on
